

Database Configuration

Database configuration is the core of the application: this is where fields are defined, along with validation lists, content types and record types.

If you are setting up an application from scratch, it is recommended that you follow through the definition tasks in the following order:

1. [Validation lists](#)
2. [Fields](#)
3. [Field Groups](#)
4. [Content Types](#)
5. [Record Type Templates](#)
6. [Fields Localization](#)
7. [Validation Templates](#)
