

Serials set-up

As well as the setups described below, you also need to set up the [Acquisitions module](#) before you can begin to use the Serials module.

Serials set-up

Before setting up individual serials, you need to define the following:

- any pre-defined [routing lists](#) you may want
- [formatting strings](#), which determine how the issue information is portrayed

Setting up the subscriptions for individual serials consists of defining:

- the frequency
- the subscription order
- the routing lists

This all comes under the [Serials Management Control Centre \(SMCC\)](#).
