

Authentication

Soutron supports the following authentication methods:

Manual login	Using username & password
ADFS SSO	ADFS acts as the Service Provider, while the client provides the Identity Provider
SAML SSO	Our implementation of SAML means that the client's IdP authenticates against ADFS which acts as the Service Provider, while the client provides the Identity Provider
Oauth & OpenID Connect	Oauth & openID SSO providers such as Google Oauth and IdentityServer can be used.
Custom Web Services	This should be discussed with Soutron to determine if we can connect with a custom web service
IP Authentication	An IP address can be assigned to a users profile, then anybody accessing the system from that IP address will be authenticated automatically as the assigned user
Native Active Directory	This is not possible if the system is hosted by Soutron. The system will connect via LDAP to update and verify a users identity before logging them into the system. Attributes that can be imported can be seen here .
